

What are the physical or behavioural adaptations which help the wolf to survive in its environment ?

The wolf is carnivorous. In the far North, he prefers eating little rodents than reindeers.

Wolves can stay more than a week without eating. In autumn, he changes his diet and consumes large quantities of salmon.

The wolf is a good swimmer and a good runner. He can travels 45 km in a night. His fur keeps him warms. His sense of smell is very developed like his hearing. The wolf lives in packs. He communicates with this pack by howling. He's a social animal.

He lives in Siberia and in Canada.
